

Camtraptions USB Switch Manual (*extract*)

Overheat Protection

The switch has an inbuilt cut-out feature that automatically turns it off if it starts to overheat. This ensures that the switch itself does not get damaged.

In practice, the switch can support devices drawing up to around **1.5 Amps** for a prolonged period of time without overheating.

If a device draws more current than **1.5 Amps**, it may be necessary to use two USB Switches in parallel.
